

The Opus engine is a fantastic addition to the EWQL Library. With that, there needed to be a little updating with many people expression maps due to Opus allowing more options and customization options for its users. To use the full extent of the library including mutes, effects (Flutter tongue, rips, etc.) and trills, there needs to be a little setting up involved. However, for most articulations, i.e. legato, accents, natural, staccato, there doesn't need to be anything to set up. These expression maps should work just fine by loading in the designated sound sample. Luckily, once you set it all set up, if you save the instrument, any future instances you need that specific instrument, the correct sound library should load automatically. I suggest doing them first, saving the instrument with the added loaded sound samples, and then leaving it. It should work perfect.

Hope this helps! Happy writing!
