

Backup WaveLab 11.2 Montage with all files

The alternative workaround by Arthur Neeman

1. Go to FILES window -> Menu -> Export File Names as Text: Path and Name & uncheck Show Path Relative to the Montage, Output Format: Pure Text (txt)
2. It will create **Montage File List.txt** in the C:\temp*****(long code name)*****\ folder. Rename this file to **list.txt**.
3. Add an empty line as first line at the beginning of the list.txt (just to have empty line at the beginning, otherwise first file won't be copied)
4. Copy Montage project file with this **list.txt** to the new (backup) folder. Create Windows command prompt batch file **WLbackup.cmd** and add these lines:
 1.

```
@echo off
setlocal EnableDelayedExpansion
md .\files
for /f "tokens=*" %%a in (list.txt) do (
  set filename="%%a"
  echo Processing file: !filename!
  copy !filename! .\files\
)
endlocal
```
5. Rename original Montage folder. Just add a single symbol at the end of folder name.
6. Start WaveLab and open Montage file from new place. It will warn you about missing files and gives you a list of them.
7. Select them all (click in the list and press Ctrl+A) and press **Find Files with the Same Name**. It will place a check mark at the beginning of each file if it was found in the subfolders.
8. That's all. Save opened backup Montage and only then rename back your original Montage folder.

End.
